法狗狗 LegalChat 对接文档

更新日期:2023.5.16

介绍

LegalChat 是法狗狗基于大语言模型技术研发的可行法律咨询机器人,目前已经导入常用法律法规、律师建议和判决案例。该咨询机器人具有理解用户意图、主动引导用户补充信息、解答用户法律问题等功能。接口使用 Websocket 协议传输,机器人回答问题时,会逐字流式返回咨询结果。由于该服务处于开发测试阶段,该接口的数据结构和用法可能随时变更,请您谅解。示例代码为 TypeScript+Vue3 代码,其他语言可以参考该结构。不是完整代码,无法直接运行。仅供您参考数据结构和对接方式。

建议采用的开发框架:

Web: TypeScript + Vue3 + Vite

安卓: Kotlin + Jetpack Compose 或其他有双向数据绑定功能的框架

IOS: Swift UI

桌面: Electron 等跨平台框架+Web 技术栈

注意事项

- 1. 一个问答一个 socket, 也就是说每次发起问题都需要新建一个 socket, 因为每次 socket 回答完成, 后端都会把 socket 关闭
- 2. 一个话题有字数限制,如果超过了后端会发送 type 为 close 的事件,也就是话题结束事件,需要用户重新咨询

接口基本信息

```

JavaScript 实现参考

工具辅助

全局变量

```
process_total=0 //总进度
process_current=0 //当前进度
chat_id= nanoid(10) //话题id
historyMsg = [{
    role:'assistant',
    content:'您好! 我是 xxxx, 很高兴为您服务。'
}] // 历史记录 role 取值 assistant 或者 user 其中 user 是用户问题类型 另外一个是答案类型
stream='' 流式字符显示
optionAnswerId= '' // 推荐问题id
recommend_list=[] //推荐问题列表
loading=false //是否正在回复
```

生成 chat_id

```
//生成随机字符串
function nanoid(len) {
  len = len || 10 //默认长度为10
  var str = ''
  var chars =
  'ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789'
  //字符集
  var charsLen = chars.length
  for (var i = 0; i < len; i++) {
    str += chars.charAt(Math.floor(Math.random() * charsLen)) //
  随机选取一个字符
  }
  return str
}
```

初始化 websocket

```
// ws_url: socket 地址
// token: token 值用来鉴权
// chat id: 话题id
// msg: 用户问题
function initWebsokcet(chat id,msg) {
 const ws_url = 'xxxx'
 const token = 'xxxx'
  const ws = new WebSocket(ws_url)
  ws.onopen = () => {
   ws.send(token)
   ws.send(chat id)
   ws.send(msg)
  ws.onmessage = (data: any) => {
    let event: any = JSON.parse(data.data)
    add_message(event)
  ws.onclose = () => {
    loading = false
  ws.onerror = (err) => {
   loading = false
   console.log(err)
   console.error('服务器连接失败')
 }
}
```

核心业务流程

用户发送问题

```
function sendQes (msg) {
    if(loading) return
    loading = true
    recommend_list =[] //清空推荐问题
    optionAnswerId=nanoid(10)
    //添加历史记录
    historyMsg.push({
        role:'user',
        content:'msg',
    })
    //每次发送消息都需要重新建议 socket
    initWebsokcet (chat_id,msg)
}
```

用户发送推荐问题

```
function sendrecommendQes (msg) {
 optionAnswerId=nanoid(10)
 recommend_list =[] //清空推荐问题
  if (msg==='重新咨询) {
 chatId =nanoid(10) //开启新话题
  stream=''
 historyMsg = [
     role: 'assistant',
     content: '您好! 我是 xxx, 很高兴为您服务。',
    } ]
  return
if(loading) return
loading = true
//添加历史记录
historyMsg.push({
 role: 'user',
 content:'msg',
})
//每次发送消息都需要重新建立 socket
initWebsokcet (chat id,msg)
```

接收答案并添加到前端聊天记录中

```
function add message(answer) {
  switch (answer.type) {
    case 'close' :
     recommend_list = ['重新咨询']
      loading = false
    case 'char':
     process current = 0
     process total = 0
      const content = answer.content //回答内容
      if((content !== '[换行]' && content !== '[结束]') return
stream+=content
      if(content === '[换行]')
        return historyMsg.push({role: 'assistant',content:
stream}
                               //结束
                               loading = false
     historyMsg.push({role: 'assistant', content: stream})
      const current stage id = optionAnswerId = nanoid(10) //当前
推荐问题id
      //获取推荐问题接口
      const last message ={ role: 'assistant', content: stream }
      const BASE URL HK= 'https://service-1dbgn4h6-
1254426977.hk.apigw.tencentcs.com/release/predict'
      stream = ''
      fetch(BASE_URL_HK, {
        method: 'POST',
       body: JSON.stringify({ history: last message }),
      })
        .then((res) \Rightarrow {
         return res.json()
        })
        .then((data: any) => {
          //如果不是当前推荐问题直接抛弃
          if (optionAnswerId == current stage id)
recommend list.value = data['data']
        })
     break;
    case 'process': //分析进度
```

已过期的说明

建议

```
建议采用的数据结构和变量:
class MessageItem {
```

```
role: string
content: string
(role:string,content:string){
    this.role = role
    this.content = ""
}

const history: Ref<Array<MessageItem>> = ref([]) // 聊天记录
const input = ref("") // 输入框
const stream = ref("") // 流式回复
const process_current = ref(0) // 法典阅读进度
const process_total = ref(0) // 法典长度
const recommend_list: Ref<Array<string>> = ref([]) // 推荐回复列表
```

const is_closed = ref(false) // 长链接是否关闭

const loading = ref(true) // 是否加载中

Collst loading = rej(title) // XE = XH #X T

var stage id = "" // 当前对话轮次 id, 用于丢弃过期请求

接口说明(已过期,部分可参考)

WebSocket 接口

请求地址: wss://service-1dbgn4h6-1254426977.hk.apigw.tencentcs.com/release/faxiaokai/

鉴权方式:建立 WebSocket 连接时,发送 Access Token 作为首条消息。

调试试用 Token:

 $eyJ0eXAiOiJKV1QiLCJhbGciOiJSUzI1NiIsImtpZCI6Ik9aSDJFNjlrZUROYzluSEdfemRwaGxqSjJ1b2tHaW5SRml0ajdxTldOS3cifQ.eyJzdWliOiI2NDQwOWJhYzlhNjhhOWFkZTM0ODcxZWEiLCJhdWQiOiI2NDQwOTM0MzI0ZTAyNGEwZjI3YjFmZjUiLCJzY29wZSI6InByb2ZpbGUgcGhvbmUgb2ZmbGluZV9hY2Nlc3Mgb3BlbmlkIGVtYWlsIiwiaWF0IjoxNjgyNjczMzc4LCJleHAiOjE2ODM4ODI5NzgsImp0aSI6ImhMZU1kQmhjaC0ybWlZZVZYd042YXVodWd6N0VUWjFlaDZiT0gwRjliRU4iLCJpc3MiOiJodHRwczovL2xlZ2FsLWNoYXQuYXV0aGluZy5jbi9vaWRjIn0.c6ZqYw3u2W_mLbIUFC9TUPCnlPQxZWDbIpsqSZ0P8dkmf0wBATvoSSGyoOTh0CbhyUzRJGdaZxLaVvCxcVw4wNBilP7i3P0VOgvBIzd4TZPubGxUA61yLJxdH_i9Ouo163tUsI6gjNgnU1ijAQULsjDeAF5sz0p6eZJDWiqk8g1NxtuCdY4cV3Ru8wsF3JjRgyogatLOf3Z6MghBZrCvk7zTuvRiW991M8rK00n1anW8jyQkPRqgVLnY7L7bcln-iFP-$

5gMxDJXK_gvu45_RzBssGeEhP1qbb7M7Rc6P61agjmu666nJFLAgkME1xmHrPxva4LuoYGm1srhc06TJ9w

鉴权示例代码:

```
const ws = new WebSocket("wss://service-1dbgn4h6-1254426977.hk.apigw.tencentcs.com/release/") ws.onopen = () => {
```

```
ws.send(`${上文中给出的试用 token}`)
传入数据:直接向 WebSocket 发送用户问题
示例代码(TypeScript + Vue3):
ws.send(input.value)
接收数据示例:
1、字符
正常字符: {"type": "char", "content": "\u60a8"}
结束标识: {"type": "char", "content": "[\u7ed3\u675f]"}
收到字符后,应将收到的内容加入 stream 向用户展示,直到收到 [结束] 标识时将 stream 放到
history 中。
2、进度条
{"type": "process", "current": 1, "total": 8}
示例代码(TypeScript + Vue3):
ws.onmessage = (data: any) => {
  let event: any = JSON.parse(data.data)
  switch (event.type) {
    case "char":
      process_total.value = 0
      if (event.content == '[结束]') {
        stage_id = nanoid(10)
        let predict_history = []
        if (history.value.length > 1) {
           let last_ask = ""
           for (let item of history.value[history.value.length - 1].content.keys()) last_ask = item
           predict_history.push({"role": "user", "content": last_ask})
          predict_history.push({"role": "assistant", "content": stream.value})
           predictQuestion(predict_history, stage_id) // 该方法实现见下一个接口
        loading.value = false
                  history.value = history.value.concat([new MessageItem("robot", stream.value)])
      } else stream.value += event.content
      break
    case "process":
      process_current.value = event.current
      process total.value = event.total
      break
  }
```

Http 接口

```
请求地址: http://service-1dbgn4h6-1254426977.hk.apigw.tencentcs.com/release/predict 传入数据:json, 传入参数为最后一条回复。形式如 {"history": {"role": "assistant", "content": "XXX"}}
示例代码(TypeScript + Vue3):

function predictQuestion(last_message: any, current_stage_id: string) {
    if (is_closed.value) return
        fetch(`${BASE_URL_HK}/predict`, {
        method: "POST",
        body: JSON.stringify({"history": last_message})
    }).then((res) => {
        return res.json()
    }).then((data: any) => {
        if (stage_id == current_stage_id) recommend_list.value = data['data']
    })
}
```
